AI Handles the Grind. We Develop the Leaders.

A vet-owned firm's AI playbook

PAUL NAVARRO · CO-FOUNDER, ALN LEADERSHIP DEVELOPMENT & COACHING · OCTOBER 26, 2026

AUTHENTIC LEADERS NAVIGATE WITH CONFIDENCE

A startup built to develop leaders

Two owners. Service-disabled veteran-owned. One mission, at three levels:

Lead Yourself

Self-awareness first. DISC, coaching, and the habits that make you steady under pressure.

Lead Your People

Communication, trust, and getting the best from the people around you.

Lead the Organization

Culture, teams, and leaders who build other leaders.

SHOW OF HANDS

Who in this room is also the entire back office of their business?

The grind that steals the mission

Small firms cannot afford a back office. So the owner becomes the back office.

- Reading solicitations
- Writing proposals
- Follow-up emails
- Invoices
- Scheduling
- Event research
- Social posts
- Receipts
- Client prep
- Reports

THINK ABOUT IT

Which one of these ate your last Sunday afternoon?

The toolset: an office, builders, and staff

1

Google Workspace

The office. Email, Drive, Calendar, Sheets, Forms.

Where the work lives

2

Claude + Codex

Claude builds what I describe. Codex, from a second AI company, checks the work.

Builder and inspector

3

Microsoft Foundry

The staff. AI models that draft, score, and summarize inside the app.

Who does the work

4

Stripe + Eventbrite

The cash register. Payments and registrations flow in on their own.

How money arrives

Chatbot vs. an Agentic OS

Same AI underneath. The difference is who does the walking.

A chatbot

You open it, ask a question, copy the answer, paste it somewhere, and remember to do it again tomorrow.

An agentic OS

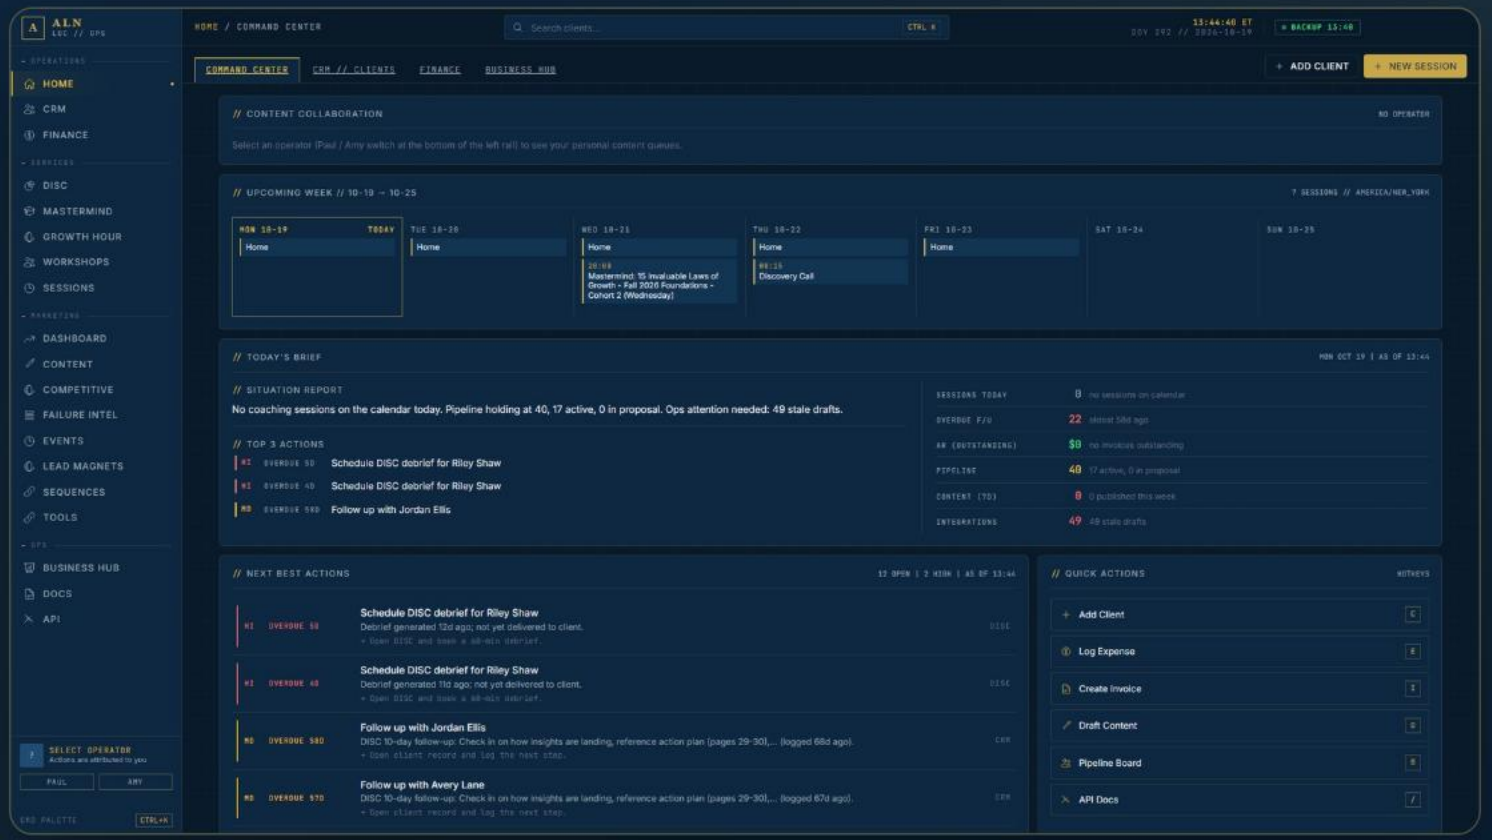

Small helpers that each own one job. They watch the inbox, do the work on a schedule, and hand it back to me to approve.

THE HONEST PART

I am not a software developer. I built ours from scratch by describing what I needed, one problem at a time.

One screen to start the day

The week ahead, today's brief, and the next best actions, ranked for us before coffee.

Illustrative view: client names and personal details have been changed.

What runs while we coach

- **About 20 modules on one dashboard**
  Clients, DISC, proposals, events, finance, content, Mastermind cohorts.
- **36 scheduled jobs, running on their own**
  Reading inboxes, scoring opportunities, sending pre-approved follow-ups.
- **One digest email every evening**
  What is due, what is overdue, and anything that broke today.
- **One Decision Center**
  Where Amy and I approve what goes out the door.

One rule under everything

AI drafts

Fast first versions of the work nobody wants to start.

The Owner Approves · Judgment stays human

The code locks it

Once we sign off, the system is not allowed to change it.

From state solicitation to bid package

1 · Triage

eVP notices are read and scored for fit: pursue, review, or no bid. Cheap rules first, AI only when needed.

2 · Brief

AI reads the scope and writes a bid memo: proceed, proceed with caution, or pause, plus what is unknown.

3 · Build

Twelve sections drafted, reviewed, approved, then assembled into PDF, Word, compliance matrix, and cover email.

WATCH FOR

The moment the system refuses to overwrite a section we already approved.

Watch: solicitation to bid package

RECORDED DEMO, SHOWN LIVE

A real state solicitation goes from inbox triage to an AI capture brief, twelve drafted sections (one approved section stays locked), and an assembled bid package with a compliance matrix.

Speed is nice. Trust is the point.

What it does

Reads the scope, flags compliance items, drafts every section in the voice of our approved work, and builds the package.

What it will not do

Invent prices, past performance, or certifications. Overwrite approved work. Submit anything.

TRY IT MONDAY

Paste a public solicitation into an AI tool and ask for a compliance checklist and a bid or no-bid memo. Prompt 1 on your handout.

A client finishes an assessment. Nobody touches a file.

1 · Notice

The system sees the completion email and pulls the full assessment report.

2 · Prepare

Client folder, scores, a tailored 50-minute debrief plan, and an audio overview script.

3 · Follow Through

Invite waits for our approval. Ten and thirty day check-ins go out on schedule, with a feedback survey.

Watch: assessment to debrief-ready

RECORDED DEMO, SHOWN LIVE

A finished DISC assessment lands in its client folder; minutes later a tailored debrief plan and audio overview script appear, and the debrief invite waits in the Decision Center for a human to approve.

The machine preps. The human coaches.

The prep moved

Folders, file naming, report reading, debrief outline, follow-up timing.

The attention stayed

The conversation, the insight, the relationship. That is the product.

TRY IT MONDAY

Pick the one client workflow you repeat every week. Write its steps down. That list is your first automation spec. Prompt 3 on your handout.

Which rooms are worth our Saturday?

1 · Gather

Chamber emails, the NCVetBiz events page, and web search, on a schedule.

2 · Score

0 to 100 against our four ideal client profiles, with a plain-English reason and red flags.

3 · Decide

I approve or decline, attend, log contacts, and track cost per qualified conversation.

Watch: event list to scored decision

RECORDED DEMO, SHOWN LIVE

Events gathered from chamber emails and the web are scored 0 to 100 against our ideal client profiles, with a plain-English reason, and a person makes the final call.

Your best prompt is your ideal client

1

Who buys

Title, company size, and the problem keeping them up at night.

2

Where they gather

Associations, chambers, summits like this one.

3

Red flags

No budget, wants it free, wrong fit. Say it plainly.

4

Your edge

Why you, in one sentence. Vet-owned counts.

30 SECONDS, RIGHT NOW

On the back of your handout, write one sentence: who is your ideal client?

Four things to try. No code required.

1

Bid / No-Bid

Paste a solicitation. Get a compliance checklist and a recommendation.

2

Event Scorer

Paste your ideal client and an event list. Get a ranked shortlist.

3

Follow-Up Drafter

Paste meeting notes. Get a follow-up email you edit and send.

4

Write It Down

Any task you do twice a week: list the steps. That is a future helper.

ON YOUR HANDOUT

Full copy-and-paste prompts for all four, plus the guardrails, are on the handout you are holding.

Six guardrails from a cyber guy

1. **Protect client data**
   Use a business plan, or strip names and personal details before you paste.
2. **Make it show its sources**
   Ask what it based the answer on, and what it does not know.
3. **A human sends it**
   Anything that leaves the building gets a person's eyes first.
4. **Never let it invent credentials**
   Past performance, certifications, and prices come from you, not the model.
5. **Get a second opinion**
   Check important work with a second AI from a different company. Do not bet the business on one vendor.
6. **Start with one annoying task**
   Not a strategy. One task. Then the next one.

Let the machine carry the grind. You lead.
